

# "Is your 3" brand name exhaust really a 1.5" exhaust?"

589 flowing in

## What does this all mean?

Based on a 3" system that flows 589cm, the reduction to 589cfm through the metal cat is approximate a 10% loss down to 534cfm. Meaning the 3" pipe work is being reduced to 2.7" as a comparative measure. When looking at the drop through the standard cat used in competing systems, the drop to 312cfm is close to a restriction of 3" pipe work being reduced to far less than 2", which is a massive suppression especially in forced induction vehicles. Is the cat in your exhaust system the weakest link? Choose your catalytic converter wisely, choose Metal Cat.

- \* 100% Stainless inside and out
- \* Uses a unique 200 cell p/inch high performance full metal catalyst
- \* Compact size for small and mid size cars and trucks
- \* Fully polished
- \* EPA and CARB Compliant [stamped]
- \* Heat Shield comes standard
- \* Stamped with CAxx
- \* Available in 2.25", 2.5", 3" and 3.5"
- \* Metal Cat ships as a complete unit
- \* Outflows competition
- \* Ideal for forced induction vehicles
